IN THE CLAIMS

Please amend the claims to read as follows:

Listing of Claims

1-16. (Canceled).

17. (Previously Presented) A transmitting apparatus used in a mobile communication system to transmit a signal by radio to a communicating party, the transmitting apparatus comprising:

a symbol rate determiner that determines a symbol rate of a transmitting signal based on a channel variation speed between transmission and reception of a received signal, said symbol rate of the transmitting signal being made greater in response to an increase in the channel variation speed so as to make a channel variation between symbols or in a burst relatively minute; and

a transmitter that transmits data by radio based on said determined symbol rate,

wherein said symbol rate determiner determines the symbol rate such that a product of a transmitting time and a channel variation speed per symbol maintains a constant value.

- 18. (Previously Presented) A transmitting apparatus used in a mobile communication system to transmit a signal by radio to a communicating party, the transmitting apparatus comprising:
- a symbol rate determiner that determines a symbol rate that minimizes an error rate based on a channel variation speed and a relative delay time of multipaths; and
- a transmitter that transmits data by radio based on said determined symbol rate.
- 19. (Previously Presented) A transmitting apparatus used in a mobile communication system to transmit a signal by radio to a communicating party, the transmitting apparatus comprising:
- a symbol rate determiner that determines a symbol rate that minimizes an error rate based on a channel variation speed and a delay profile; and
- a transmitter that transmits data by radio based on said determined symbol rate.
 - 20-28. (Canceled).
- 29. (Previously Presented) A transmitting method used in a mobile communication system to transmit a signal by radio to a communicating party, the method comprising:

detecting a channel variation speed between transmission and reception of a received signal; and

determining a symbol rate of a transmitting signal having a best error rate characteristic from the channel variation speed and relative delay times of multipaths.

30. (Previously Presented) A transmitting method for use in a mobile communication system for transmitting a signal by radio to a communicating party, the method comprising:

detecting a channel variation speed between transmission and reception of a received signal; and

determining a symbol rate of a transmitting signal having a best error rate characteristic from the channel variation speed and a delay profile.
